Background

I started coding during my Computer Science degree, but most of my growth has come from going far beyond coursework and constantly building things on my own. I'm naturally drawn to building. If I'm not working on something for school or work, I'm usually experimenting with a new idea, tool, or feature just because I want to see how it works. I've spent a lot of time teaching myself new technologies and applying them across full-stack projects—from frontend interfaces to backend services, databases, and data flows. Through building full-stack applications, iOS apps, and Chrome extensions, I've developed the ability to take ideas from concept to something real and working. I've also grown these skills professionally as a full-stack developer at Schedulearn, working on production features and turning product requirements into reliable implementations. Along the way, I've grounded everything in core computer science fundamentals like data structures, algorithms, and system design so that what I build is not just functional, but structured and reliable.

What I'm Best At

I'm at my best when I can focus deeply on a problem and work through it until it's fully understood and solved properly. I pay a lot of attention to detail, both in how systems are structured and how they behave, and I tend to notice when something is slightly off—whether it's in the logic, the data flow, or the user experience. I don't like leaving things in a "good enough" state, and I'm willing to spend the time to make sure something is clean, consistent, and actually makes sense. I'm comfortable sitting with something for as long as it takes to break it down, understand what's really going on, and get to a solution I trust. That often means digging deeper than the surface issue, thinking about edge cases, interactions between components, and how small decisions affect the system as a whole. I approach problems with patience and curiosity, and I bring a high level of care to getting things right.

Let's build something together,

Jeremy Jacob
