Professional Summary

I'm a full-stack developer with hands-on experience building and operating production software end to end, with particular strength in turning product ideas into polished, user-facing systems that are both technically sound and genuinely useful. My work spans modern frontend development in React, Next.js, TypeScript, and JavaScript; backend development in Python, Node.js, and Express; database-backed functionality in SQL and Supabase; and the APIs, data flows, and debugging work required to make those layers function cleanly together.

Professionally, I've contributed to production applications at Schedulearn and on client-facing web projects, translating product requirements into maintainable implementations, shipping features, improving reliability, and working across the stack rather than in a single narrow layer. At the same time, a major part of my experience comes from building my own products from scratch, especially Kartiseret, where I've owned the full lifecycle of a real full-stack platform, including frontend architecture, data modeling, scraping and enrichment pipelines, external data integration, automation, and the overall user experience. Beyond that, my projects reflect a consistent ability to identify specific user pain points and solve them thoughtfully through different platforms and technologies, whether that means building a local-first browser extension like FeedScroller to help users resume fast-moving feeds, a macOS utility like ColorCal to create beautiful menubar calendar views, or an iOS app like Shabbat Alarm Clock that puts users first.

Across all of this work, what stands out most is my combination of technical range, product thinking, and depth of execution: I'm comfortable designing responsive interfaces, structuring backend logic, integrating third-party systems, shaping databases, and staying with a problem long enough to make the final result feel clean, reliable, and well considered rather than merely functional.

Let's build something together,

Jeremy Jacob
